

Sunlink Product Change Simplifies System Installation.

FOR IMMEDIATE RELEASE:

May 1, 2008. San Rafael, California.

SunLink Corporation announced today a significant improvement to its PV mounting system product. SunLink has long recognized that one of the best opportunities for PV contractors to improve margins is by reducing installation time. "Our new tilt bracket eliminates a time consuming step, making assembly of this component three times faster," says SunLink VP Design, Robert Miros.

What was once a tedious multi-step process; fitting the base to the bracket, fitting the tool and then bending as many as ten tabs per base is now completed in 1/3 the time with a squeeze and a snap.

Installers are enthusiastic about the new design that reduces worker fatigue, particularly stress on the hands and wrists. "SunLink has made a simple process even better," says Adam Larner of Bass Electric, "I can see this saving significant man-hours on every project."

Owners and PPA providers are equally enthusiastic about this improvement which also speeds disassembly times, which can be an important component of reroofing or system relocation costs.

SunLink's new product will replace the old design and is available for sale immediately. Visit us at <http://www.sunlink.com> for more information.
